### A GUIDE TO A JAM PRODUCTION UNIT

#### 1 - PRESENTATION

# 1-1 Nature of Activity

The unit produces jams, jellies, and marmalades. It allows for the valorization of fruits that do not correspond to the specifications for commercialization of fresh fruit or other transformations.

#### 1-2 Alternatives

#### \* Raw Materials:

- Fresh fruit: the most frequently used in small or medium sized units that function principally during harvest periods.
- Fruit or frozen pulp, principally in units that produce all year round and when this type of supply is available. Freezing allows for better preservation of the organoleptic quality of the raw materials.

It is also possible to obtain appertized and stabilized pulps (SO2).

For the jellies and marmalades, we use fruit juices or concentrates as well as citrus fruit rinds.

### \* Finished Products:

Three products: jams, jellies, marmalades.

Definition of products (French legislation): for 1000 g of finished product:

- Jam: mix of 350 g minimum (generally but with the exception of certain fruits) of pulp or purée of one or various fruits and sugar.
- Extra Jam: 450 g minimum (generally) of pulp or purée of fruits.
- Jelly: mix of 350 g (generally) of juice and/or liquid extracts from one or various types of fruits and sugar.
- Extra Jelly: 450 g minimum (generally) of juice or liquid extract.
- Marmalade: mix of 200 g of pulp, puree, juice, liquid extract or rinds of citrus fruits or sugar.

There is also another category of high quality jams and marmelades containing fruit pieces.

# \* Technology:

In the case of a supply of fresh fruit, the process begins with a preparation phase for the fruit. Certain steps of this phase may be specific to certain fruits (peeling, stoning, barking, etc.). These pre-processing lines are more or less mechanized, depending on the size of the unit.

At the beginning of the preparation phase, the principal option is which cooking process must be chosen:

- cooking under atmospheric pressure in vats (discontinuous) which is the traditional method,
- cooking in a vacuum:
- . discontinuous, in vacuum-concentrators,
- . continuous, in smooth surface heat exchangers, (a sophisticated process not yet well developed.

Cooking in vacuum allows for the lowering of the cooking temperature (better preservation of organoleptic quality and nutrients as well as energy savings), which leads to greater control of the cooking process and higher yields.

### \* Packaging:

- Glass jars (most common size: 375 g)
- Cans 4/4 or 5/1
- Aluminium or plastic packaging in individual portions essentially destined for organizations and cafés, hotels, and restaurants.

### 1-3 Types of Possible Units

There are three types of units:

Unit A: with a 100 kg/hr capacity and cooking in vats.

Supply: fresh fruit during the harvest period.

Complementary workshop of a unit which processes or packages fruit and vegetables.

Unit B: with a 300 kg/hr capacity and discontinuous cooking in vats.

Supply: fresh fruit during the harvest period.

Unit C: with a 700 kg/hr capacity and discontinuous cooking in a vacuum in vacuum-concentrators.

Supply: fresh fruit during the harvest period.

## 3 - KEY FACTORS TO THIS PROJECT'S SUCCESS

# 3-1 Supply

It is necessary to have access to an abundance of raw materials at competitive prices. Moreover, the period between harvest and processing must be very short. The units must therefore be located at the production sites and should foresee contracts with producers for at least part of their supply.

In the case of continuous supply of fruit that is not over-ripe, the cold room is not needed. The supply of jars and cans can be difficult: foresee sufficient stocks.

## 3-2 Technology and Equipment

The technology must be mastered : the parameters for sugar/fruit/pectin/acid determine the firmness of the jam.

Cooking in vats is particularly difficult because of the risks of overheating (among the skilled workers, a cook is necessary for unit A).

The equipment for the preparation of the fruit must be adapted to the fruit being prepared. A peeler for pineapples, a pitter and refiner for mangoes, etc...

# 3-3 Quality Control

The primary equipment necessitates a pH meter and a refractometer (to control acidity and the sugar content).

## 3-4 Building

The size of the storage area depends on the availability of packaging and the flux in the commercialization on the finished product.

### 3-5 Distribution and Commercialization

The exportation of jams is difficult, considering the cost of transportation and the low added value of the finished product.

One must therefore target the domestic market or the markets of neighbouring countries.

There exists an export market for certain jams of specific exotic fruits.

## 3-6 Financing

The required working capital is significant because one must assure the stocking of the finished product between seasonal production and continuous marketing.

### 4 - INDUCED ACTIVITIES

A production of fruit adapted to industrial demand.
