INDUSTRY BRIEFING PAPER READY MEALS

SYNOPSIS

INDUSTRY BRIEFING PAPER FOR READY MEALS

This activity supplies consumers with prepared food which can be used quickly. These products are well adapted to urban zones with a relatively high level of purchasing power.

The principal alternatives of the project concern:

- finished products:
 - with a meat base (of beef, pork, mutton, poultry, ...) and/or fish.
 - complete ready-to-eat dishes which require reheating, or meat in sauce (the consumer prepares the garnish)
- * range of recipes

- targeted markets:
 - products intended for local market
 - typical products of a region, intended for export

- the technology of preservation: 5 distinct channels are-described (see the production process chart).

the method of raw material supply :

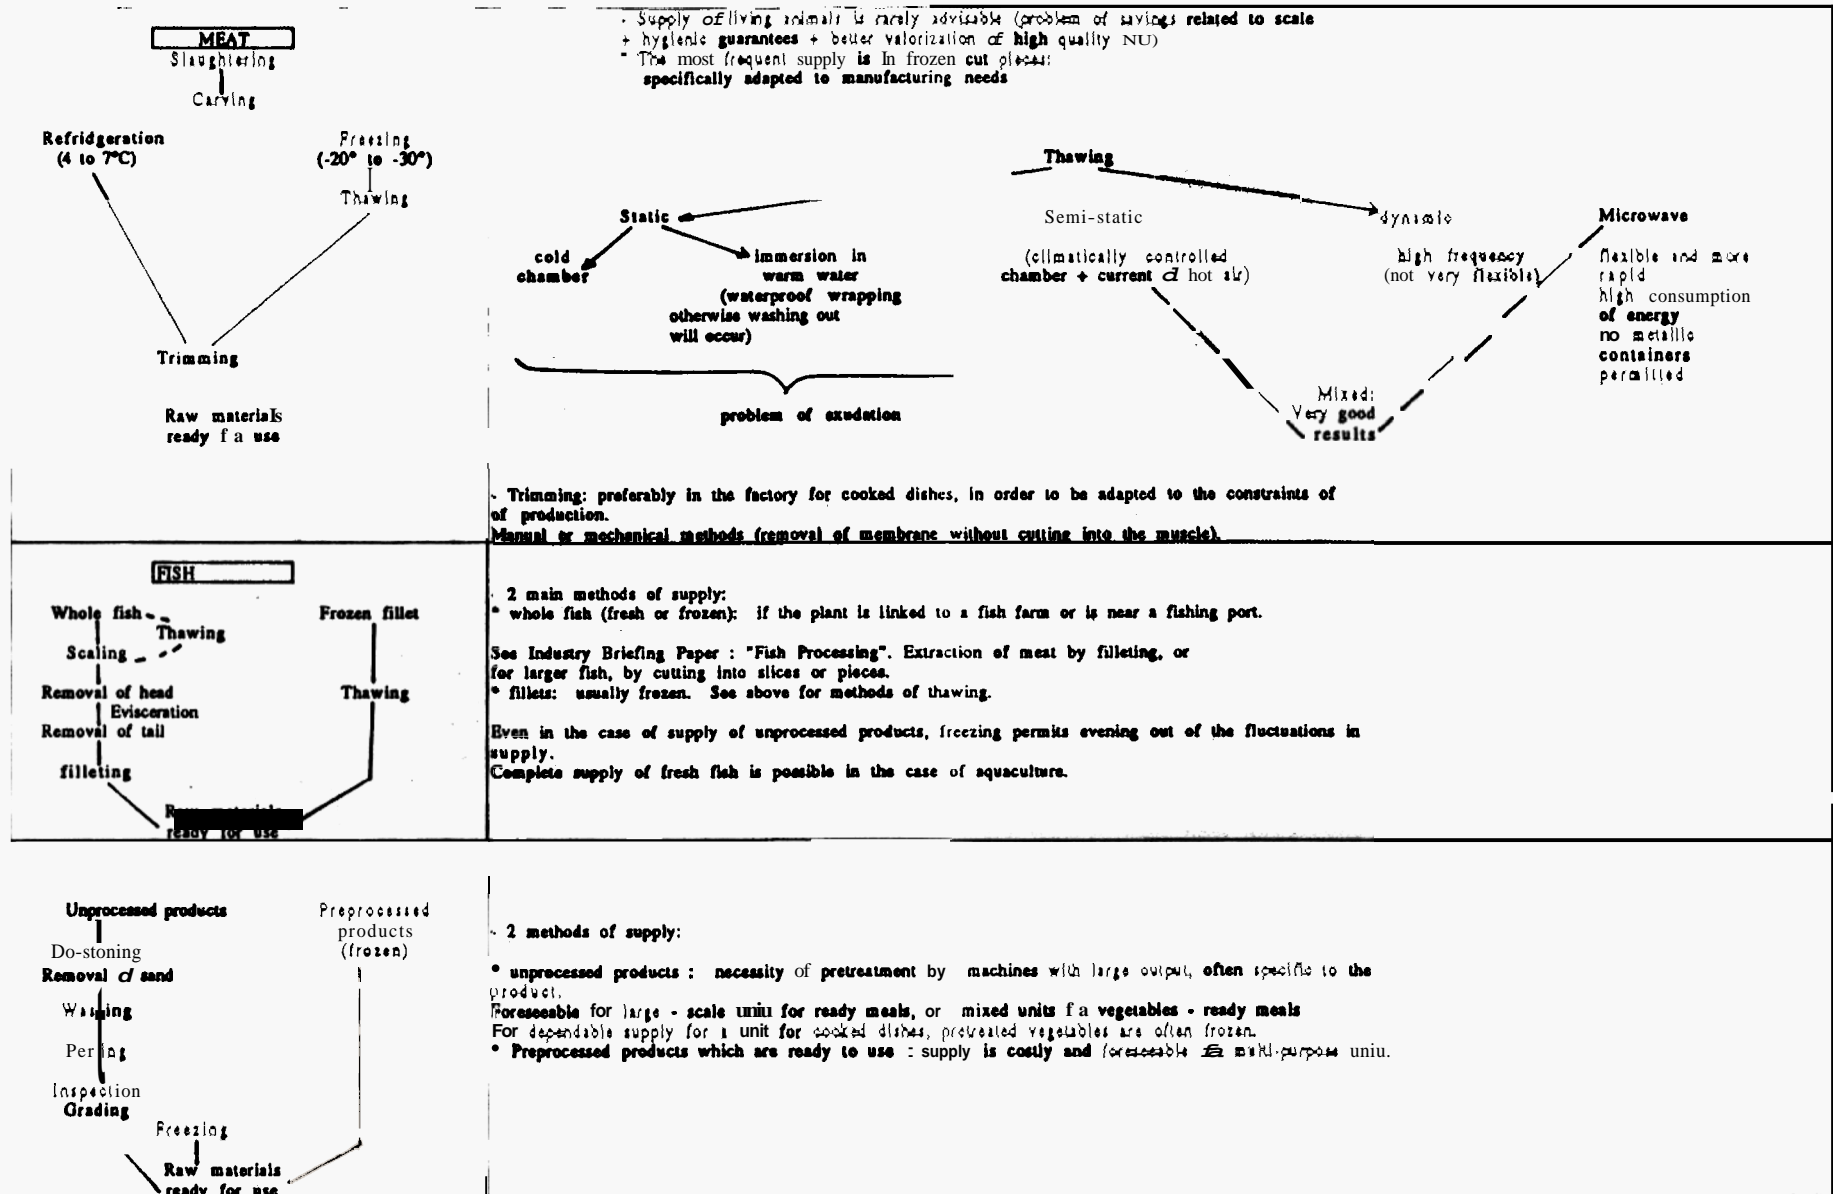

Before beginning the operations of cooking/preservation, raw materials must undergo first transformation which is practically identical in all cases.

Depending on the opportunities for the supply of raw materials (their quality, price, etc...), the manufacturer may choose:

- * a supply of unprocessed products: manufacturer must assure first transformation (see corresponding paper)
- a supply of more or less processed products : pre-cut meat, fillets of fish, graded frozen vegetables, etc.

FIRST TRANSFORMATION

The choice of the method of supply naturally depends on the local availability of semi-processed products
 For pretreatment of unprocessed products see Briefing Papers: "Meat", "FW Processing" and "Fruit and Vegetables"

CANNED READY MEALS

- Advantages**
- finished products can be stored at room temperature, and have long shelf life. No need for cold chain, nor cold storage for the distributor or consumer.
 - limited risk of poisoning: easily controllable scale for sterilization.
 - technology adapted to very different capacities. Equipment exists for small capacity (for jars or metal cans).

- Disadvantages:**
- problem of supply of packaging materials (jars or metal cans may be very expensive)
 - organoleptic qualities are affected by treatment.

OPERATIONS	POSSIBLE CHOICES OF TECHNOLOGY
<div style="display: flex; justify-content: space-between;"> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of ingredients - mixtures</div> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of packaging (washing)</div> </div>	<p>Choice of Packaging : this is the basic choice</p> <ul style="list-style-type: none"> - Rigid: * opaque: - metal can (tin plate, aluminum) - A tin can is the classic method of packaging. Necessitates a nearby can factory (imports are extremely expensive due to the volume of the containers). Easy to put into use. Very resistant. - thermoshaped plastic. Polypropylene. Delicate heat sealing * transparent: - Glass jar with glass cover; very high cost of packaging, mechanization is impossible, but it is possible to recover the jars (foreseeable for artisanal units). Sterilization without risks. - glass jar with a metal cover, screwed or capped on. Possibility of mechanization and recuperation (returnable jars). More adapted to pasturized products. - semi-rigid: small plastic trays or combinations of aluminum-polypropylene or cardboard-plastic film. Heat-sealing of cover is delicate. Sophisticated technology. - Flexible : sachets made of complex materials. Sophisticated heat-sealing technology.
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: auto;">Dosage</div>	<p>Dosage : To place the exact quantity of the product in the package by weight or volume depending on the homogeneity of the product. Simple technology.</p>
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: auto;">Packaging crimping capping</div>	<p>Packaging : To hermetically seal the packaging before sterilization. Depends on the choice of the container.</p> <ul style="list-style-type: none"> - Crimping: for metal cans - large range of equipment. - Screwing on of the cover: for jars - large range of equipment. - Sealing: for plastic containers.
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: auto;">Cooking - Sterilization</div>	<p>Sterilization : to cook and sterilize the product.</p> <p>2 ways: continuous and discontinuous.</p> <ul style="list-style-type: none"> - Discontinuous: autoclaves with baskets. Can be developed by addition of more autoclaves. Wide range of adjustments and adapted to all sizes of cans. However, production rate is limited and much labour is needed. - Continuous: vertical or horizontal. <ul style="list-style-type: none"> - water + steam or direct heating with a flame. - different systems of handling. <p>Heavy investment. Difficult to use with many formats. Especially adapted to large series of tin cans.</p>
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: auto;">Labelling - Final wrapping</div>	
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: auto;">Placing on palets</div>	

VACUUM-PACKED READY MEALS

- Advantages
- better technology for preservation of organoleptic and nutritional qualities
 - longer shelf life compared to fresh products (from 6 to 40 days according to the process)
 - existent equipment for small installations

- Disadvantages
- risks in the technology: possibility of poisoning if cold chain is not mastered, expiry date of product not respected or production tables not mastered.
 - sophisticated packaging materials.
 - problem of homogeneity of treatment for small capacity equipment

OPERATIONS	FUNCTIONS	POSSIBLE CHOICES OF TECHNOLOGY
<div style="display: flex; justify-content: space-between;"> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of ingredients</div> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of packaging</div> </div>		<ul style="list-style-type: none"> - Certain raw materials may be precooked before packaging. - A multitude of packaging materials are available: small trays or film, simple or compound materials
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: 0 auto;">Dosage - mixing</div>		Classic equipment for high-quality cooking or AFI (agro-food industry) (See "Canned Ready Meals")
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: 0 auto;">Packaging in a vacuum or in a modified atmosphere</div>	Placement in a vacuum reduces the occurrence of oxidation and the resistance to transfer of heat. Packaging before cooking limits exudation and increases output.	A large range of equipment from the simple bell jar to continuous processing machinery.
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: 0 auto;">Cooking at low temperature (< 100°C)</div>	Cooking according to optimum scale of temperature (no overcooking)	<ul style="list-style-type: none"> - Traditional materials: covered pot for water bath cooking chest. - Low investment. - Specific equipment (especially derivatives of pressure cookers) can cook and cool in the same container.
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: 0 auto;">Cooling</div>	Rapid lowering of the temperature of the product to prevent the proliferation of bacteria.	<ul style="list-style-type: none"> - Immersion in cold water. - Spraying of cryogenic fluids. - Circulation of cold air.
<div style="border: 1px solid black; padding: 2px; width: 80%; margin: 0 auto;">Final packaging Final wrapping</div>	Protective final wrapping that helps selling (printed cardboard)	Usually cardboard boxes

DEEP FROZEN READY MEALS

- Advantages
- finished products have a long shelf life
 - preservation of organoleptic and nutritional qualities
 - technology **can be** adapted to very different capacities
 - low cost of packaging for simple systems
- Disadvantages
- necessity of negative cold chain (storage in plant, **transport.** storage at the distributors' and consumers')
 - **risks of poisoning in case of thawing/refreezing**

OPERATIONS	POSSIBLE CHOICES OF TECHNOLOGY		
<div style="display: flex; justify-content: space-between;"> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of ingredients mixing</div> <div style="border: 1px solid black; padding: 2px; width: 45%;">Preparation of packaging</div> </div> <div style="text-align: center; margin-top: 20px;"> <pre> graph TD A[Preparation of ingredients mixing] --> C[Dosage - mixing Dosa el- mixin] B[Preparation of packaging] --> C C --> D[Packaging] D --> E[Deep-freezing] E --> F[Storage Rnal packaging Final wrapping] </pre> </div>	<p>Choice of packaging : choice of secondary importance (does not determine the selection of the project)</p> <p>it depends on 3 main criteria:</p> <ul style="list-style-type: none"> • state of the product (solid or not) • presentation of the final product (packaging) • use by the consumer (reheating in a pan, in a hot water bath, an oven or by microwave) <p>Options</p> <ul style="list-style-type: none"> * a plastic bag (with cardboard box as final wrapping) the simplest and least expensive solution * small tray (aluminum or polymer/cardboard) + heat-sealed cap. Mechanization. • thermoshaped container and cover: adapted to microwaves. Simple technology but costly packaging. Mechanization possible. <p>Dosage - mixing See "Canned Ready Meals"</p> <p>Packaging Depending on packaging:</p> <ul style="list-style-type: none"> • bagging • placing in small tray • heat sealing or capping with a cover <p>Deep Freezing the product is rapidly cooled to -18° in the centre</p> <p>2 main methods:</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50%; border: none; vertical-align: top;"> <p style="text-align: center;">Cryogenic cold</p> <p>The cooling power of compressed gas is used by direct contact: liquid nitrogen, frozen CO₂</p> <p>Advantages: simple installation of freezing equipment</p> <p>Disadvantages:</p> <ul style="list-style-type: none"> • high cost of freezing products • indispensable to be near plants for compressed gas <p>Equipment:</p> <ul style="list-style-type: none"> • cell • tunnel </td> <td style="width: 50%; border: none; vertical-align: top;"> <p style="text-align: center;">Mechanical cold</p> <p>Refrigeration set with compressor, evaporator and refrigerant gas (NH₃ or freon)</p> <p>Different equipment available:</p> <ul style="list-style-type: none"> • plate freezer with plates: for small facilities and thin products • deep freezing cells • deep freezing tunnels (the products are placed on carts or conveyors) </td> </tr> </table> <p>Prevent dehydrating of surface (risk of freezer burns)</p> <p>Final packaging</p> <p>Cardboard is often used for final wrapping (indispensable in the case of packaging in sachets). --> protection and attractiveness</p>	<p style="text-align: center;">Cryogenic cold</p> <p>The cooling power of compressed gas is used by direct contact: liquid nitrogen, frozen CO₂</p> <p>Advantages: simple installation of freezing equipment</p> <p>Disadvantages:</p> <ul style="list-style-type: none"> • high cost of freezing products • indispensable to be near plants for compressed gas <p>Equipment:</p> <ul style="list-style-type: none"> • cell • tunnel 	<p style="text-align: center;">Mechanical cold</p> <p>Refrigeration set with compressor, evaporator and refrigerant gas (NH₃ or freon)</p> <p>Different equipment available:</p> <ul style="list-style-type: none"> • plate freezer with plates: for small facilities and thin products • deep freezing cells • deep freezing tunnels (the products are placed on carts or conveyors)
<p style="text-align: center;">Cryogenic cold</p> <p>The cooling power of compressed gas is used by direct contact: liquid nitrogen, frozen CO₂</p> <p>Advantages: simple installation of freezing equipment</p> <p>Disadvantages:</p> <ul style="list-style-type: none"> • high cost of freezing products • indispensable to be near plants for compressed gas <p>Equipment:</p> <ul style="list-style-type: none"> • cell • tunnel 	<p style="text-align: center;">Mechanical cold</p> <p>Refrigeration set with compressor, evaporator and refrigerant gas (NH₃ or freon)</p> <p>Different equipment available:</p> <ul style="list-style-type: none"> • plate freezer with plates: for small facilities and thin products • deep freezing cells • deep freezing tunnels (the products are placed on carts or conveyors) 		

DEHYDRATED READY MEALS

Advantages

- finished products **can be stored at room temperature**
- rapidity and **ease** of preparation for **the consumer**

Disadvantages

- sophisticated technology
- **heavy investments**

Alternatives :

- Usually, the manufacturer of dehydrated ready **meals** only mixes and packages ingredients which are already dehydrated. In fact, the dehydration of the different ingredients **can call for different technologies.**
- The processes differ in the method of **drying** which varies according to the **raw material.**

OPERATIONS	FUNCTIONS	PROCESSING TECHNOLOGIES AND OPTIONS
<p>Unprocessed products</p> <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px auto;">Cooking</div>		Most of the products are cooked before drying.
<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px auto;">Drying</div>	<p>Elimination of water --> preservation + reduction of product's weight</p>	<p>The process differs according products treated.</p> <ul style="list-style-type: none"> * Drying by hot air: products placed in carts, in a tunnel oven with circulation of hot air (70°C to 140°C). Time of drying about 5 hours. Used for fruit and vegetables. • Drying by atomization: used for liquids and colloidal solutions. Time of drying: several seconds. • Drying by fluidization: the moist product passes on a hot air fluidized bed. Used for cereals, vegetables and pulverized products. * Drying by suspension: after mechanical disintegration, the products are carried along by a current of hot gas. Used for pulverized moist products. * Drying by drum dryer for purée-type products - baby food
<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px auto;">Grinding</div>	<p>Depends on the desired characteristics of the finished product.</p>	
<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px auto;">Mixing</div>	<p>Blending of the ready meals</p>	
<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px auto;">Packaging</div>		In a sachet (aluminum or compound), in a small boat, or small cups with heat sealed lids.
